Functions

Undercurrent monitoring (UNDER)

When the measured current exceeds the value adjusted at the MAX-regulator, the output relay R switches into on-position (yellow LED illuminated). When the measured current falls below the value adjusted at the MIN-regulator, the set interval of the tripping delay (DELAY) begins (red LED MIN flashes). After the interval has expired (red LED MIN illuminated), the output relay R switches into off-position (yellow LED not illuminated). The LEDs MIN and MAX are flashing alternating, when the minimum value for the measured current was chosen to be greater than the maximum value.
